

JIALIN XU

Gameplay & Level Designer

Shanghai, China · +86 181 3612 3672 · jialincurryxu@gmail.com

PROFESSIONAL SUMMARY

Gameplay and Level Designer with 5 years of professional experience across AAA tactical RPG, classic FPS remake, and open-world projects. Experienced in combat abilities, mission mechanics, encounter design, level production, and content-development tools, with hands-on Unreal Engine experience spanning requirements breakdown, whiteboxing, implementation, debugging, and final delivery. Comfortable collaborating across design, engineering, art, and production in distributed teams and English-language client reviews.

CORE SKILLS

Gameplay Design Requirements breakdown, gameplay rules and states, mission mechanics, ability implementation, configuration standards, edge-case handling, first-playable development	Level & Encounter Design Design documentation, whiteboxing, spatial layout, player guidance, encounter pacing, AI and objective configuration, cinematic flow, environmental storytelling
Unreal Engine Blueprint, Sequencer, UMG, Editor Utility Widget, Data Assets, trigger logic; working knowledge of Unreal C++ for small gameplay modules, Actor Components, and Blueprint-exposed APIs	Tools & Data Python, JSON, Visual Studio, Perforce, Git, Git LFS, Jira, Confluence, Excel, PowerPoint, Photoshop

PROFESSIONAL EXPERIENCE

Tengyu Interactive Technology — Shanghai, China

Gameplay Designer | Honor of Kings: World

Mar 2026 – Jun 2026

- Designed a photo-based mission flow using an existing photography feature, defining mission conditions, target presentation, optional trigger zones, feature availability rules, and success criteria. Removed unnecessary distance, angle, and framing constraints and delivered the core playable version.
- Scoped the UI, motion, and audio dependencies for a countdown framework. Coordinated with quest design, technical design, production, and external stakeholders to assess rework risks associated with replacing the legacy UI and adjust the production plan.

Virtuos Shanghai — Shanghai, China

Game Designer

Nov 2020 – Jul 2025

Unannounced Classic FPS Remake	Jul 2023 – Feb 2025
- Designed and implemented a narrative reveal sequence built around a mechanical decoding set piece. Positioned the reveal along the only exit route and used prop placement, spatial composition, and FOV tuning to guide player attention without locking the camera; the sequence passed client review and was integrated into the daily build. - Rebuilt a legacy blackout event for UE5 and the updated character controller. Revised the playable space, event pacing, and visual occlusion; recreated lighting, cinematic, trigger, and AI logic; and restored the relevant world states before and after the event. - Defined the design requirements for a legacy level-script parser and UE5 visualization tool, including positional data, action order, probability fields, and event/tag relationships. - Collaborated with engineering on the text-parsing, JSON, and UE5 editor pipeline, contributing Python and Editor Utility Widget logic. The tool supported script search, viewport navigation, event-chain visualization, and full action-sequence inspection.	

Marvel's Midnight Suns — DLC

Jul 2021 – Feb 2023

- Delivered five DLC maps and 10 combat encounters from whitebox through release. Translated story beats and combat goals into playable layouts, coordinated concept and environment production, reviewed assets, resolved gameplay issues, and supported final bug fixing.
- Implemented abilities for four DLC heroes and selected enemies in Unreal Engine based on approved designs. Broke each ability into movement, animation, presentation, UI, damage, and state logic, and used Blueprint debugging to resolve target-filtering, duplicate-UI, enemy-state, and character-movement issues.
- Built and configured the revised Feeding Frenzy encounter. Adjusted special-enemy and civilian placement around the opening shot, player start position, and attack ranges to prevent multiple objectives from being cleared by a single opening AoE while preserving tactical opportunities for environmental attacks and knockback combinations.
- Established material-slot naming and configuration rules for dynamic skin switching, completing system integration for more than 20 skins across four DLC heroes. Triaged configuration and source-asset issues and verified subsequent fixes.
- Created an art-independent graybox test map that provided a fast validation environment for level mechanics, special enemies, and animation configurations, and documented its use for other project contributors.

EDUCATION

University of California, Santa Cruz

2016 – 2020

Bachelor of Science in Computer Science: Game Design
